Question 1 [CO1] [10 Points]

Design and implement a Java program that performs the following tasks:

- First, ask the user to enter a number **n** that is greater than 0.
- Then, take n **number of user inputs** (from 0 to 9): If the user enters a **negative digit**, display: "**Please enter a digit between 0 and 9.**" and re-prompt for the same digit. And, construct **a number** using the **n inputs in** reverse order of how they were entered. **Then, print the constructed number.** For example, if the user inputs: **2 1 4 3 6**, the constructed number is: **63412. [Hint: Multiply each digit by the appropriate power of 10 based on its position and add them together.]**
- Now, check whether the constructed number follows the pattern: **All digits of the number must be in strictly decreasing order (Can not be equal either). If the number has only one digit, it is always considered a valid pattern.** Finally, show A message stating whether it is a **Valid Pattern** or **Invalid Pattern**. If it's an invalid pattern, also calculate and **print** how many times the pattern is **not broken.**

[N.B: You can not use arrays, strings, or any built-in methods except MATH.pow()]

Sample Input	Sample Output
Enter the value of n: 5 **Enter digit 1: 1** **Enter digit 2: 2** **Enter digit 3: 5** **Enter digit 4: 7** **Enter digit 5: 8**	**Constructed number:** 87521 **Pattern check:** Valid Pattern **(Explanation:** The pattern follows the sequence: 8>7>5>2>1, with digits strictly in decreasing order.)**)**
Enter the value of n: 4 **Enter digit 1: 1** **Enter digit 2: 3** **Enter digit 3: 4** **Enter digit 4: -1** **Enter digit 4: 4**	Please enter a digit between 0 & 9. **Constructed number**: 4431 **Pattern check:** Invalid Pattern **Pattern Not Broken:** 2 times **(Explanation:** The pattern follows the sequence: 4=4>3>1. The pattern broke at the beginning because the first 4 was equal to the second 4, not strictly decreasing. The pattern did not break twice, at the transition from 4 to 3 and 3 to 1. Therefore, the pattern is invalid, and it did not break 2 times.)
