Question 1 [CO1] [10 Points]

Write a Java program that simulates a simple digital game store. The program should **begin by taking two integer inputs from the user**: **1) the first input is the user's initial wallet balance 2) the second input is the number corresponding to the game the user wants to purchase.**

The store offers four games: **Game 1 (Puzzle Quest – 70 Taka), Game 2 (Racing Thunder – 90 Taka), Game 3 (Space Blaster – 110 Taka), and Game 4 (Kingdom Builder – 130 Taka)**. the program must check the following conditions:

- If the user selects a game and the balance is insufficient to purchase it, the program should display the message **"Insufficient balance for selected game."**
- **If the input is valid and the user has enough balance**, the program should deduct the price from the balance.
- Then, the program must check if the remaining balance is divisible by 3. If it is, a success message should be printed along with the final balance.
- However, if the remaining balance is not divisible by 3, the program **should take another integer user input to make another purchase**. This second purchase should follow the same rules . After this step, regardless of whether the second purchase succeeds or fails, the final balance should be displayed.

Sample Input	Sample Output
Enter your initial wallet balance: 300 Enter the number of the game you want to purchase (1-4): 2	Game purchased successfully! Success! Your remaining balance is divisible by 3. Final balance: 210 Taka
Enter your initial wallet balance: 310 Enter the number of the game you want to purchase (1-4): 2 Choose another game to purchase (1-4): 3	Game purchased successfully! Your remaining balance is not divisible by 3. Second game purchased successfully! Final balance: 110 Taka

EXPLANATION for sample input 2: The user started with a balance of 310 and purchased item 2(90 Taka), leaving an odd balance of (310-90)= 220 tk. Since the remaining balance was not divisible by 3 so, customers had to buy another item: Item 3 (110 Taka), resulting in a final remaining balance of (220-110)=110tk and a successful purchase.
