Ques no 1

Write a Java program that accepts an algebraic expression containing terms of **x** and **y** as input. The program should simplify the expression by summing the coefficients of like terms and display the final simplified result.

- **Constraints:**
    - Only variables x and y are supported.
    - The only operations allowed are addition (+) and subtraction (-).
    - **Example:** Input 7x+3x-2y-1y+4x → Output 14x-3y.

Input	output
7x+3x-2y-1y+4x	14x-3y
5x+7y-7x+9y	-2x+16y

Ques no 2:

Write a Java program that takes two strings as input: a **Target String** (to search for) and a **Source String** (to search within). The program should count and display how many times the Target String appears inside the Source String.

- **Constraints:**
    - The search must be **case-sensitive** (e.g., "Ban" is different from "ban").
    - If the count is 0, the program must print: "it is a unique string".
    - **Example:** Input ban and Banan are black ban → Output 2 time.

Input	output
Ban Banana	1 time
ban Banan is black ban if bana	2 time
Up I am a student of brac University	0 time it is a unique string
